Your Calm Voice of Reason

Objective, data-driven mixing feedback that guarantees measurable improvement in 3 days—regardless of your skill level, environment, or gear.

Start AnalyzingLearn More

AIFRED AI Assistant

I've analyzed your track. Your low-end shows a +3.2dB buildup around 120Hz. Here are your next steps:

1. Apply a high-pass filter at 30Hz on your master bus

2. Create a 2dB cut at 120Hz with Q of 2.0

3. A/B test against your reference track

Expected improvement: -2dB reduction in low-mid mud, clearer kick definition

E) NOISE, tails, edits

- Clean start/end: leave a tiny pre-roll if needed, and allow reverbs/delays to fully decay.
- Remove clicks, pops, unintended breaths, or background noise between sections (if relevant).

F) Export specs (deliver what mastering expects)

- **WAV or AIFF**
- **24-bit** (your project is 24-bit—keep it)
- **Sample rate:** 48 kHz or 44.1 kHz is most common; 96 kHz is fine if requested. If you stay at **96 kHz**, confirm the mastering engineer wants it.
- **No dithering needed** at 24-bit unless you're reducing bit depth.

G) Deliver versions + notes (this saves revisions)
Send:

- 1) **Mix print** (no limiter, headroom left)
- 2) Optional: **"With mix-bus processing"** version if that processing is part of the sound
- 3) **Instrumental / Acapella / TV mix / clean version** if applicable
- 4) **Reference tracks** + a note: "I want it as loud as X but keep transients" / "Warmer top, less bright" etc.

5) MEASURE — quick final validation
Before sending, check these on the exported premaster:

- **True Peak:** ≤ -3.0 dBTP
- **No clipping** anywhere
- **Stereo correlation:** generally positive (you're already at 0.9)
- **A/B at matched loudness:** premaster vs your old loud version—premaster should feel the same balance, just quieter/less "finished."

Next action
Tell me whether your exported file currently has a limiter on the master. If yes, I'll tell you exactly how many dB to pull it back (or what to bypass) to hit a clean -3 dBTP premaster while keeping your mix balance intact.

1:38:26 PM

What should I check before sending my mix for mastering?

1:38:26 PM

Can you analyze my current mix and tell me what needs improvement?

1:33:17 PM

2) Fix the 120 Hz buildup (targeted, not global)

- Identify which element owns 120 Hz (often kick tail, bass/808 harmonics, low synth, room tone).
- Apply one of these:
- **Static EQ:** -1.5 to -3 dB at **110–140 Hz**, **Q 1.0–1.4**
- **Dynamic EQ:** same frequency, only dipping on boomy hits (**2–4 dB max**)
- Optional: sidechain filter on any bus compressor so low end doesn't over-trigger it (HPF detector **80–120 Hz**).

Expected outcome: tighter low end, clearer kick/bass separation, less "cloud" in the groove.

3) Brightness / sibilance control

Because highs are +0.9 dB and "slight sibilance" is flagged:

- **De-esser (if vocals exist in this print):** center **6–8 kHz**, aim **1–3 dB reduction** on S/T.
- If no vocals, focus on hats/synth sheen:
- Dynamic EQ dip around **7–10 kHz** when hats get sharp (1–2.5 dB)
- Or a gentle high-shelf trim: **-0.5 to -1.5 dB @ 8–12 kHz**

Expected outcome: less fatigue, limiter behaves smoother, translation improves on earbuds.

4) Dynamics: add density without killing punch

Given **crest factor 12.9 dB**, use "staged" control:

- **Drum bus glue:** ratio **2:1**, attack **20–30 ms**, release **80–150 ms**, aim **1–2 dB GR**
- **Bass control (if uneven):** ratio **3:1–5:1**, attack **20–40 ms**, release **80–150 ms**, aim **2–4 dB GR**
- If you want more loudness without mush: try **transient shaping** on drums (reduce sustain slightly) instead of heavier compression.

Expected outcome: more consistent groove, perceived loudness increases at the same LUFS, fewer peaks hitting the limiter.

5) MEASURE (how to confirm each improvement)

After changes, re-check:

- **True Peak:** aim **≤ -1.0 dBTP** (or **≤ -3.0 dBTP** for master delivery)
- **LRA:** your current **8.7 LU** — for many beats, **~5–8 LU** feels controlled; if it's still jumpy, you'll see it here.
- **Low-end clarity check:** compare before/after on small speakers—120 Hz issues often show up as "too much thump, not enough note."
- **Top-end fatigue:** listen quietly; harshness is easier to detect at low volume.

Next action

If you tell me the genre and whether this file contains vocals, I'll give you a **track-by-track priority map** (kick/bass/drums/music/vocal) plus exact targets for **GR (dB)**, **LUFS**, and **true peak** for your final print. If you can upload a short 20–30s loudest section, I can be even more specific about what's causing the 120 Hz buildup and where the transient spikes are coming from.

A screenshot of a web application interface for 'AI FRED', an audio mixing and mastering assistant. The interface has a dark theme. On the left, there is a vertical sidebar with a blue circular icon containing a white waveform. The main content area is a dark grey rectangle with rounded corners. It contains a welcome message, a list of analysis metrics, and a goal statement. The metrics are listed in a bulleted format with blue dots. The goal statement is in a lighter grey box. At the bottom, there is a text input field with a placeholder question.
